

Jewelry from the Future

Jewelry from a 3D printer? Yes, you can! Digimorphé designs and produces fancy jewelry in an unusual way.
The start-up company was founded in 2013 by Consuelo Keller. She is a digital artisan, who explores the possibilities made available through open source software and hardware, creative coding and 3D printing, combining these elements with traditional techniques and handiwork. The jewelry, consisting of bracelets, rings and necklaces made from a variety of materials, is available at six different stores, like Fidelio and the concept-store Gris at Europaallee in Zurich.

Precisely how Consuelo Keller designs the jewelry and what she likes about her job can be seen in the video below:
